Corrosion-Proof Hydrolink Plastic Chain and Components

for water and wastewater treatment applications

Easy to Assemble

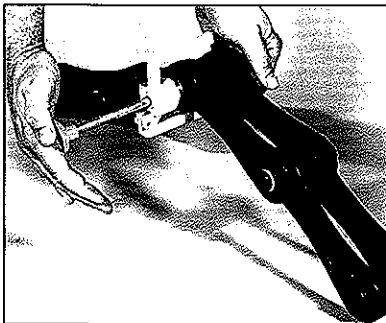

The Hydrolink's sure-clip device allows quick and easy assembly without using tools. Simply push the glass-filled nylon pin through the link keyway and the retainer clip snaps into its "safely locked" position.

Easy to Install

Accurate and safe inspection can be made at a glance with these easily-visible white clips. It takes only minutes to view the entire length of chain and determine that each link is properly assembled and secure.

Easy to Disassemble

Disassembly is no problem with our easy-to-manage six-inch delinker. To release the sure-clip, simply secure the tool onto the chain and strike the plunger with the palm of your hand—releasing the pin instantly.

Better than Metal

Independent pull-testing proves the Hydrolink will exceed the strength requirements of the most stringent applications. The chain is rated at a 6000 lb. ultimate strength and a 3,200 lb. working load. Not only does this economical chain last three times longer and weigh 75% less than metal chain, it also costs less to install, operate and maintain.

Superior Components

When you combine the easy-to-assemble Hydrolink plastic chain with heavy duty non-metallic flights and components, you've got an unbeatable combination of simplicity, efficiency and durability. Our heavy-duty lightweight fiberglass flights are strategically spaced every ten feet to accomplish efficient and economical sludge removal. The non-metallic filler blocks insure a rigid connection between the flight attachment link and flight. The replaceable, non-metallic wear shoes provide a long-lasting, low friction wearing surface.

Commitment To Quality

The Hydrolink plastic chain and components are designed and constructed to withstand years of hard use. They are backed by a written warranty, stocked replacement parts, and a commitment on our part to service our equipment for long-term customer satisfaction.
